The first four axioms mean that V is an abelian group under addition.. Elements of a vector space may have various nature; for example, they can be sequences, functions, polynomials or matrices.Linear algebra is concerned with properties common to all vector spaces.

In mathematics, and more specifically in linear algebra and functional analysis, the kernel (also known as null space or nullspace) of a linear map $L : V \rightarrow W$ between two vector spaces V and W , is the set of all elements v of V for which $L(v) = 0$, where 0 denotes the zero vector in W .That is, in set-builder notation, $= \{v \in V \mid L(v) = 0\}$.

Geometric algebra is a very convenient representational and computational system for geometry. We firmly believe that it is going to be the way computer science deals with geometrical issues.

At some point a longer list will become a List of Great Mathematicians rather than a List of Greatest Mathematicians. I've expanded my original List of Thirty to an even Hundred, but you may prefer to reduce it to a Top Seventy, Top Sixty, Top Fifty, Top Forty or Top Thirty list, or even Top Twenty, Top Fifteen or Top Ten List.

Some of the vertices of a convex n -gon are connected by segments, such that any two of them have no common interior point. Prove that, for any points in general position, there exists a one-to-one correspondence between the points and the vertices of the gon, such that any two segments between the points, corresponding to the respective segments from the gon, have no common interior point.

Let's not forget about $E=mc^2$, the famous equation which has been degraded into nothing but a complex-looking decoration in everything from kids' cartoons to science shows. ($E=mc^2$ is actually Albert Einstein's formula for mass-energy equivalence; far more people have heard of it than have any idea of what it actually means). Especially comical if it's pronounced "eeyemseetwo" by people who don't ...
